Aim: Assembly Language Program to find given string is Palindrome or not.

Theory:

A palindrome string is a string when read in a forward or backward direction remains the same. One of the approach to check this is iterate through the string till middle of the string and compare the character from back and forth.

Algorithm:

- 1. Initialize the data segment.
- 2. Display the message M1
- 3. Input the string
- 4. Get the string address of the string
- 5. Get the right most character
- 6. Get the left most character
- 7. Check for palindrome.
- 8. If not Goto step 14
- 9. Decrement the end pointer
- 10. Increment the starting pointer.
- 11. Decrement the counter
- 12. If count not equal to zero go to step 5
- 13. Display the message m2
- 14. Display the message m3
- 15. To terminate the program using DOS interrupt
 - a. Initialize AH with 4ch
 - b. Call interrupt INT 21h
- 16. Stop

Flowchart:

Conclusion:

In conclusion, the development of a program to determine whether a given string is a palindrome or not offers a practical and effective solution to a common problem. Through careful analysis and implementation of string manipulation techniques, we've crafted a reliable algorithm that efficiently evaluates any input string. Palindromes, with their symmetric charm, stand as intriguing linguistic constructs, and our program serves as a versatile tool to discern their presence or absence within a given text. As technology continues to advance, such programs not only showcase the power of computational linguistics but also contribute to a deeper understanding and appreciation of language and its intricacies.
